I agree John, I'll be staying far away from the quite zone thank you very much, I did notice the animal cruelty, reminded me of when I was a kid and I called the APL about some people down the street who kept a doberman pincher in a pen with no water and his ears eaten 1/2 way off by the flies, the poor things was malnourished and must have

Besides, if they can observe our every move, which I believe they can, they will just shut off whatever you tried to defend against and switch to something else. Which may very well be much worse than the known evil you're now subjected to. Learned helplessness. My experience is that things get better for me the more I figure out about how this stuff works. For example I would *love* to see the electro-gravitic effects some targets have reported. That would be an excellent opportunity for me to observe how it works, maybe even reverse-engineer it. But I question whether the really advanced stuff that appears to be contradicting the known laws of physics is happening the way the targets report. Maybe there is some sort of magic trick involved. My eyes are wide open to the sorts of deceptions they use by now, and what do you know, they are holding back now. After several weeks of isolation, the days blend together, and if you're getting fed realistic dreams, you may have a hard time telling the difference between the dream world and reality. Just a thought. This is probably the most depressing part as we advance in their program. If it's as big as we think and goes as high as we suspect then we're pretty much ****ed... Sorry to rain on our parade. I think that targets who live alone are pretty much sitting ducks. Even if you can shield against every conceivable e-attack, there's still the problem of agents breaking into your living quarters, vandalizing your stuff, etc. And if you turn your place into a fortress, that's swell, but how do you make a living? Alternative living arrangements are going to be necessary. Evolve or die.

What you didn't read in your own entry is that the lack of EM interference isn't a result of blocking or shielding. A unique combination of geography and legislation has rendered its 13,000 square miles nearly free of electromagnetic pollution. And if you do a little research on where this is and the kind of people that live there, the fact of the matter becomes clear: there is little EM smog in the area because they're a bunch of hicks who don't want cell phones or any of the other conveniences of the modern world. And the area is on the other side of large mountain from the metropolitan areas that do have these conveniences. In effect nobody's jamming or shielding anything. The animal cruelty point just shows how stupid and backwards these people are. I had a few ebay auctions last year that donated 10% of their proceeds to a charity called dogs deserve better , a Pennsylvania outfit that on the basis of tips, goes to people's homes who have dogs chained up 7/24 in pens and cages, to convince them to bring the animal into their homes and hearts, and if they think the animal is just a nuisance, to let them take it

Perhaps what is used to keep energy from radiating out can be used to stop it from radiating into our environments Containing small transient RF emissions from office equipment from radiating outside of a room is not relevant to keeping RF energy away from your person as you live. Never mind the fact they had the federal gov't budget to work with. Well okay here's \$10 million and a team of engineers. Here's a room

Office equipment? any electronic or electromechanical device can blind Green Bank's telescope, the biggest culprit in the first category is the observatory itself. After all, it's a high tech operation crammed with sophisticated electronics and PCs. Large chambers designed to absorb radio waves - including a 5,000-square-foot conference room - have been built to make sure that, as Sizemore tells it, radiation generated in the building stays in the building. http://www.wired.com/wired/archive/12.02/quiet_pr.html You good folks can find that paste just under the photo showing sections of telescope in black n white marked: Photo by Jonathan Manzo Sections of the 100-by-110-meter telescope, which is made up of 2,004 actuator-driven panels.
